

Совсем простенькая рекурсия. Рекурсия

Вопросы рекурсии: Рекуррентные формулы и реализация

Делаем Repeat списку на lisp рекуррентно:

Образец кода на лисп (sbcl):

```
;;; Item may Replicated (repeated/mult) user defined value in the list
;;; https://www.jdoodle.com/execute-clisp-online
;;; https://highlight.hohli.com/?language=lisp&theme=googlecode
;;; https://gist.github.com/tompurl/5174818
;;;
;;; email: call89269081096@gmail.com
```

```
; This is Approaching recursive logic clause:
; (format T "~a" (cons "HO" (cons "HO" (cons "HO" nil))))
```

```
(defconstant s 7 "How much we want has repeated our_wow?")
(defvar our_wow "HO")
```

```
;;; This function recursively build list with repeated values
```

```
(defun replicateItem (n) (
  ;;Count 'cond'-ition statement"
  cond ((<= n 0) nil)
        (t (cons our_wow (replicateItem (- n 1))))
)
)
```

```
(defun numlistToString (lst)
  (when lst
    (concatenate 'string
      (write-to-string(car lst)) "-" (numlistToString (cdr lst)))))
```

```
;; main print
```

```
(format T " Happy new Year 2025! ~a say Santa-Clause now!" (numlistToString(replicateItem
```

результат нужно получить самостоятельно:
